electrodynamic transducer

excitation: force F acting on a wire of length ℓ carrying current i and located in a magnetic field B:

$$F = B \times \ell \cdot i$$

the other way round, a voltage U is induced for a wire moving with velocity u:

$$U = B \times \ell \cdot u$$

Control of membrane velocity

excellent transient behavior

- \blacktriangleright electrical $1/f\mbox{-}correction$ necessary to adjust for $Q\sim 1/f$
- \blacktriangleright control effect gets lost for high frequencies as L_E becomes important
- caution: $R_E R_A > 0 \rightarrow$ stability condition!
- ► $|R_E| \approx |R_A|$ is difficult to achieve (compensation of temperature variation of R_E)

- electrical impedance sound pressure frequency response
- Thiele-Small parameter
- cabinet types
- optimizations

horn loudspeaker

electrostatic loudspeaker

- magnetostatic loudspeaker
- loudspeaker systems

cumulative decay spectrum

- post-oscillation of the membrane produces sound pressure signal $s_\omega(t)$

$$s_{\omega}(t) = H_{\omega}(t)\sin(\omega t)$$

with

- $H_{\omega}(t)$: modulation of amplitude ω : angular frequency of the excitation signal
- ightarrow waterfall diagram of $H_{\!\omega}(t)$

NXT - distributed mode - loudspeaker

transducer principles

electrodynamic electrostatic

radiation

- directivity radiated power
- velocity distribution membrane

electrodynamic loudspeaker

- equivalent network cabinets
- electrical impedance sound pressure frequenc
- Thiele-Small parameters
- cabinet types
- optimizations

horn loudspeaker

electrostatic loudspeaker

- magnetostatic loudspeaker
- loudspeaker systems

history:

- 1991 first patent by Ken Heron of Britain's Defence Evaluation and Research Agency (DERA)
- British company NXT got a licence on the principle of operation
 - further investigation of the concept and development of the corresponding technology

Distributed mode - loudspeaker

transducer principles electrodynamic

radiation

- directivity radiated power
- membrane

electrodynamic loudspeaker

- equivalent network cabinets
- electrical impedance sound pressure frequenc
- . Thiele-Small parameters
- cabinet types
- optimizations
- horn loudspeaker
- electrostatic loudspeaker
- magnetostatic loudspeaker
- loudspeaker systems

Distributed mode - loudspeaker: principle

- NXT speakers consist of large panels
- drivers excite a great many of partial oscillations (bending waves) \rightarrow panel oscillates with 'arbitrary' local velocity distribution
- ► oscillation pattern leads to incoherent (energetic) superposition at a receiver → omnidirectional radiation characteristics (figure-of-eight in case of mounting in free space)

transducer principles

electrostatic

radiation

- directivity
- velocity distribution of a

electrodynamic loudspeaker

- equivalent network cabinets
- electrical impedance
- response
- Thiele-Small paramete
- cabinet types
- optimizations

horn loudspeaker

- electrostatic loudspeaker
- magnetostatic loudspeaker
- loudspeaker systems

Distributed mode - loudspeaker

construction:

- large panels e.g. 60x60 cm
- excitation by one or several drivers

transducer principles electrodynamic

electrostatic

radiation

- directivity
- radiated power
- velocity distribution of a membrane

electrodynamic loudspeaker

- equivalent network cabinets

- magnetostatic loudspeaker
- loudspeaker systems

Distributed mode - loudspeaker

typical amplitude response:

transducer principles

electrostatic

radiation

- directivity
- radiated power
- velocity distribution of a membrane

electrodynamic loudspeaker

- equivalent network cabinets
- electrical impedance sound pressure frequen
- Thiele-Small parameters
- cabinet types
- optimizations

horn loudspeaker

- electrostatic loudspeaker
- magnetostatic loudspeaker
- loudspeake systems

Distributed mode - loudspeaker

typical impulse response [ms units]:

transducer principles

electrodynamic

radiation

- directivity radiated power
- velocity distribution of

electrodynamic loudspeaker

- equivalent network cabinets
- electrical impedance sound pressure frequenc
- Thiele-Small parameters
- cabinet types
- optimizations

horn loudspeaker

- electrostatic loudspeaker
- magnetostatic loudspeaker
- loudspeaker systems

Distributed mode - loudspeaker

applications:

- ▶ invisible P.A. systems (e.g. speaker arrays mounted in a ceiling)
- ▶ in case of special requirements (fire retardant, cleanable)
- optical-acoustical double-usage (e.g. surface for optical projection acts as speaker as well)

history:

Oskar Heil, USA

Air motion transformer

transducer principles electrodynamic electrostatic

radiation

- directivity
- radiated power
- velocity distribution of a membrane

electrodynamic loudspeaker

- equivalent network cabinets
- electrical impedance sound pressure frequer
- response
- enhinet tunes
- optimizations
- horn loudspeaker
- electrostatic loudspeaker
- magnetostatic loudspeaker
- loudspeaker systems

Air motion transformer: principle

- ▶ folded plastic foil between permanent magnets (large air gap → strong magnets required)
- conductors along the folds (up and down)
- \blacktriangleright force across the membrane surface \rightarrow folds are opened and closed

transducer principles

electrodynamic electrostatic

radiation

- directivity
- radiated power
- velocity distribution of a membrane

electrodynamic loudspeaker

- equivalent network cabinets
- electrical impedance sound pressure frequen
- response Thiole-Small parameter
- cabinet types
- optimizations

horn loudspeaker

electrostatic loudspeaker

- magnetostatic loudspeaker
- loudspeaker systems

air motion transformer

advantages:

- \blacktriangleright small membrane movement \rightarrow efficient volume variation \rightarrow high volume flow
- ▶ typical transformation ratio: 1:5
- excellent transient behavior
